1. Code 1 and 3 have multiple ranges which could be jumper selected.

2. Set the 5 engineering units by button keys and the related LCD indicator will be on.

3. For zero center models, add "Z" at the end of the model. For example, DPT1**Z, means the range is -30-0-30/-62.5-0-62.5pa. Only ranges 1~6 have this selection.

Connection:
Different models have different electrical connections. Refer to the table as below (x means for any models).

Terminal:

Models	Connections					
	Terminal	24V	GND	OUT		
DPTX1X DPTXEX	Signal	Power+	Power-	0-10V 0-5v

Surface Mounting:
It can be installed by surface mount and connected high(+) and low(-) pressures with accessories.

Flush Mounting:

(1) Cut a 95(W)×80(H)mm rectangular hole on the wall.

(2) Assemble the panel with the transmitter as shown above. Connect the tubes (be careful of the high(+)/low(-) ports) and the electrical terminals, then coat some glue on the back of the stainless steel installation panel, insert the transmitter body into the hole and paste the panel with the wall properly.

Zero reset & Calibration:

According to different environment and sensor's characteristics, for long term of using, the sensor's accuracy may be drift. The transmitter should be zero reset after initial installed to meet the specified accuracy, and be zero reset periodically in every 6-12 months' using. It is recommended to be "zero reset" after the initial 7 days continuous working.

Zero reset: keep the high (+) /low (-) pressure ports unconnected in stable air, or directly connect them, press the button "ZERO" for 5s to perform "zero reset". It means "remove the zero drift of the transmitter in order to improve the accuracy". It is recommended that this operation could be done periodically.

Initial zero reset: when initial power on, it should be zero reset after fully warm-up and stable, to meet the specified accuracy.

Long term zero drift & reset: It may have long term zero drift after continuous working; customers can reset it periodically.

Re-calibration & zero reset: when re-calibration needed, zero reset should be done first. A qualified standard manometer is needed for re-calibration operation. Please follow the operation procedures below.

Attention:

It should be power OFF during installing and wiring. When using 24VAC, it is strongly recommended to power the unit with independent transformer. If sharing a 24VAC transformer with other equipments such as controllers, transmitters or actuators, please make sure the terminals 24V and GND are connected correctly. Otherwise, it may reduce serious damages.

Warranty:

- It has limited warranty for eighteen (18) months after the production date.
- It does not extend to any unit that has been subjected to misuse or accident.
- It is, in any event, strictly limited to the replacement or repair of the product itself.
